

SEMPELL RAISTEAM FEED WATER HEATER ISOLATION SYSTEM

Valve for use in power generation plants and industrial applications

FEATURES

- These valves are designed to bypass high pressure feed water around a group of heaters in the event of high-water level in the shell caused by a defective tube, weld or drain system.
- The time available to give protection to a turbine in modern feed systems is short but these valves can operate in approximately 5 seconds in a 300 mm bore pipe system with the minimum of hydraulic shock.
- Protection is achieved in the system by installing fast closing tee and changeover valves in the pipework around a heater or group of heaters.
- These valves are equally applicable in new or established stations.
- The motive power employed is the feedwater pressure and the system is designed to 'fail safe' in that the heaters will be bypassed if either electric or pneumatic supplies fail.

GENERAL APPLICATION

The Raisteam feed water heater isolation and bypass systems are designed to control the flow of boiler feed water, providing isolation and bypass function in the event of feed water heater tube failure. Variants utilizing medium operated systems, motor operated function are available in various configurations.

TECHNICAL DATA

Sizes:	NPS 6 -30 (DN 150 - 750)
Design:	ASME B16.34, EN 12516
Pressure class:	900 to 2500

SEMPELL RAISTEAM FEED WATER HEATER

ISOLATION SYSTEM

OPERATION - MEDIUM OPERATED VALVES

This system is designed to be 'FAIL SAFE'. Failure of the controlling electric or pneumatic supplies will cause the main changeover and outlet valves to close and so isolate the feed side of the feed heater or heater bank. Float switches on feed water heaters are intended to have contacts normally made and to break with rising water level. Relays and solenoid are normally energized and are to be continuously rated.

Assuming the unit to be in normal operation the inlet changeover valve will be in the open position with the bypass line isolated. The out of balance forces acting on the disc caused by a combination of the differential area between the bottom and top of the disc and the pressure drop across the heater bank, will hold it in this position.

The throttle valve is used to control the speed of operation of the inlet and outlet valve and remains in normally open position.

Rising water level in a heater will cause the float switch contacts to break, thereby opening the motor operated pilot valve which remains in normally close position.

When the pilot valve opens, water is exhausted from the lower chamber (A) of the operating cylinder of both the changeover valve and the outlet valve at a far greater rate than it can enter through the inlet.

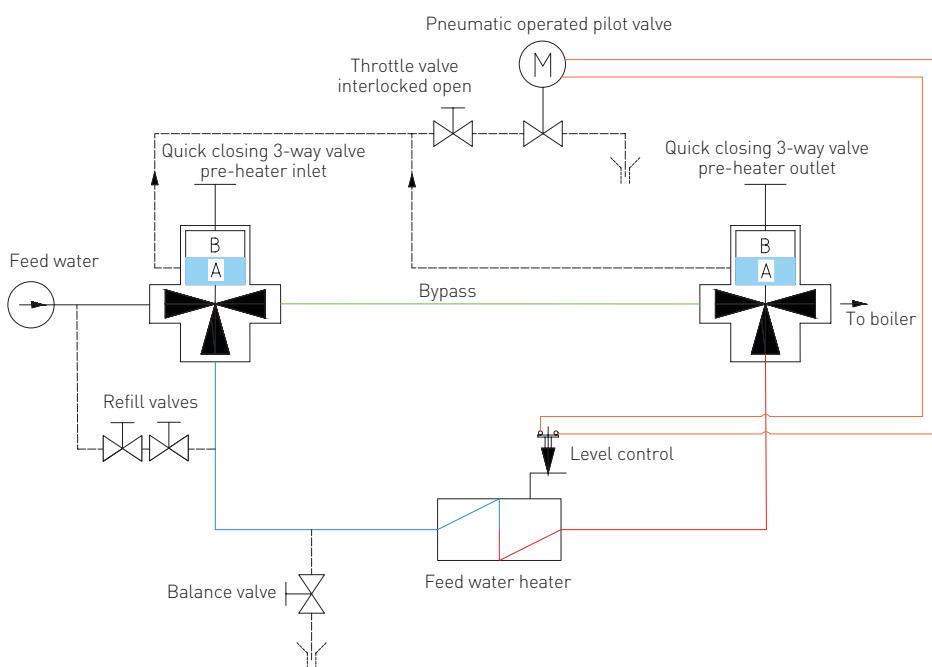

Feed water passes through the opening in bonnet into chamber (B) and the resulting pressure difference on the pistons causes both valves to isolate the heater or heater bank. During the above closing process, the balance valve has also opened and thereby reduce the pressure in the heater and feed piping to ensure that both valves are held firmly closed under all conditions.

Any increase in pressure from whatever source in the isolated section of feed water piping between the two main valves will be automatically reduced by the balance valve. At the point of main valve closure the motor operated pilot valves will also close to prevent unnecessary loss of feed water to drain.

Sempell Raisteam medium operated valves are available in a wide variety of sizes and pressure classes and can be supplied together with the ancillary equipment to suit individual customers requirements.

SEMPELL RAISTEAM FEED WATER HEATER

ISOLATION SYSTEM

QUICK CLOSING MEDIUM OPERATED VALVE LOW TEMPERATURE (<300 °C) AND HIGH TEMPERATURE (>300 °C)

SEMPELL RAISTEAM FEED WATER HEATER ISOLATION SYSTEM

OPERATION - MOTOR OPERATED VALVES

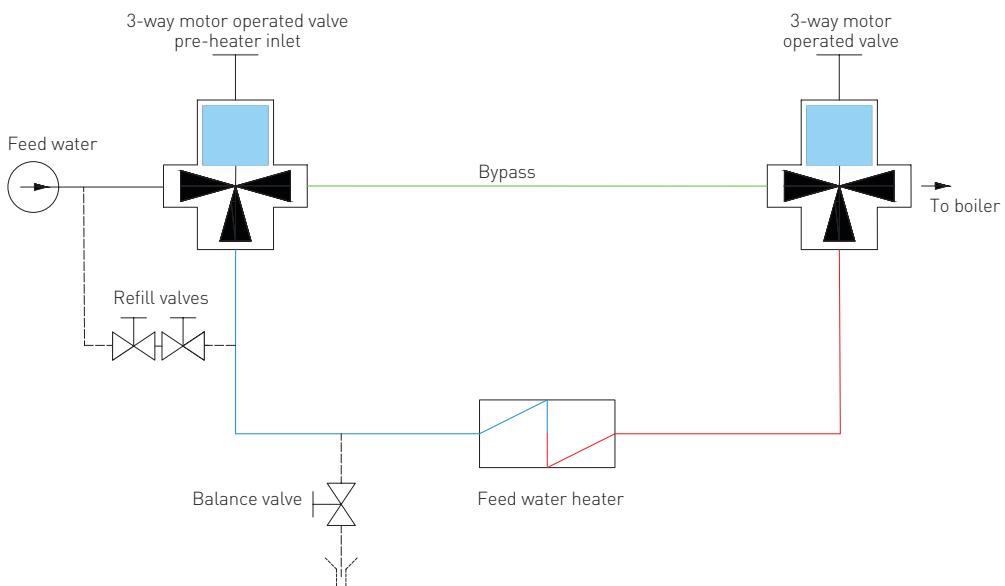

This system is designed to be 'FAIL SAFE'. Failure of controlling electric or pneumatic supplies will cause the main changeover and outlet valves to close and so isolate the feed side of the feed heater or heater bank. This is achieved by configuring the motor in such a way that failure of controlling electric or pneumatic supplies shuts the feed side and connects inlet valve to bypass line.

Assuming the unit to be in normal operation, the inlet changeover valve will be in the open position with the bypass line isolated.

Unlike the medium operated valves, modifications and operation of the motor operated valves may be carried out by the end user as per the control system of the plant and plant requirements.

SEMPELL RAISTEAM FEED WATER HEATER

ISOLATION SYSTEM

3-Way Inlet Motor Operated Valve:
Sizes NPS 10 - 26 (DN 250 - 650)

DIMENSIONS (Metric)

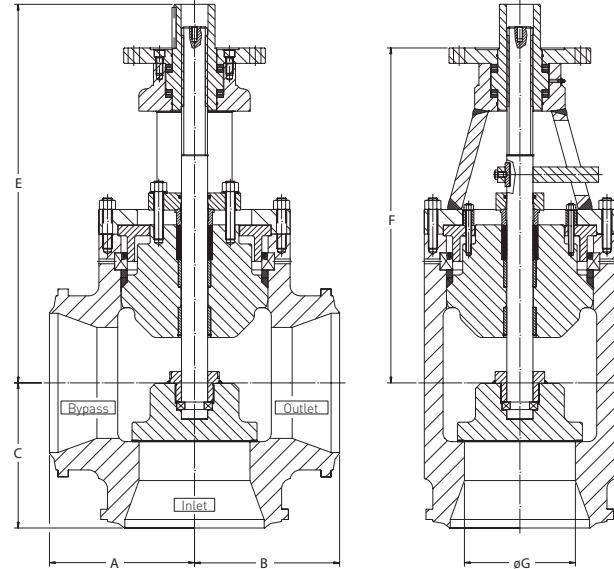

Size NPS	A	B	C	D	E	F	ΦG
10	275	275	275	465	885	813	160
12	325	325	325	550	935	866	200
14	325	325	325	620	1070	999	240
16	390	390	390	705	1180	1108	280
18	425	425	425	790	1305	1232	325
22	460	460	460	865	1505	1436	360
26	540	540	540	967	1555	1486	380

3-Way Outlet Motor Operated Valve:
Sizes NPS 14 - 18 (DN 350 - 450)

DIMENSIONS (Metric)

Size NPS	A	B	C	E	F	ΦG
14	325	325	325	1025	953	240
16	390	390	390	1025	953	280
18	425	425	425	1050	981	325

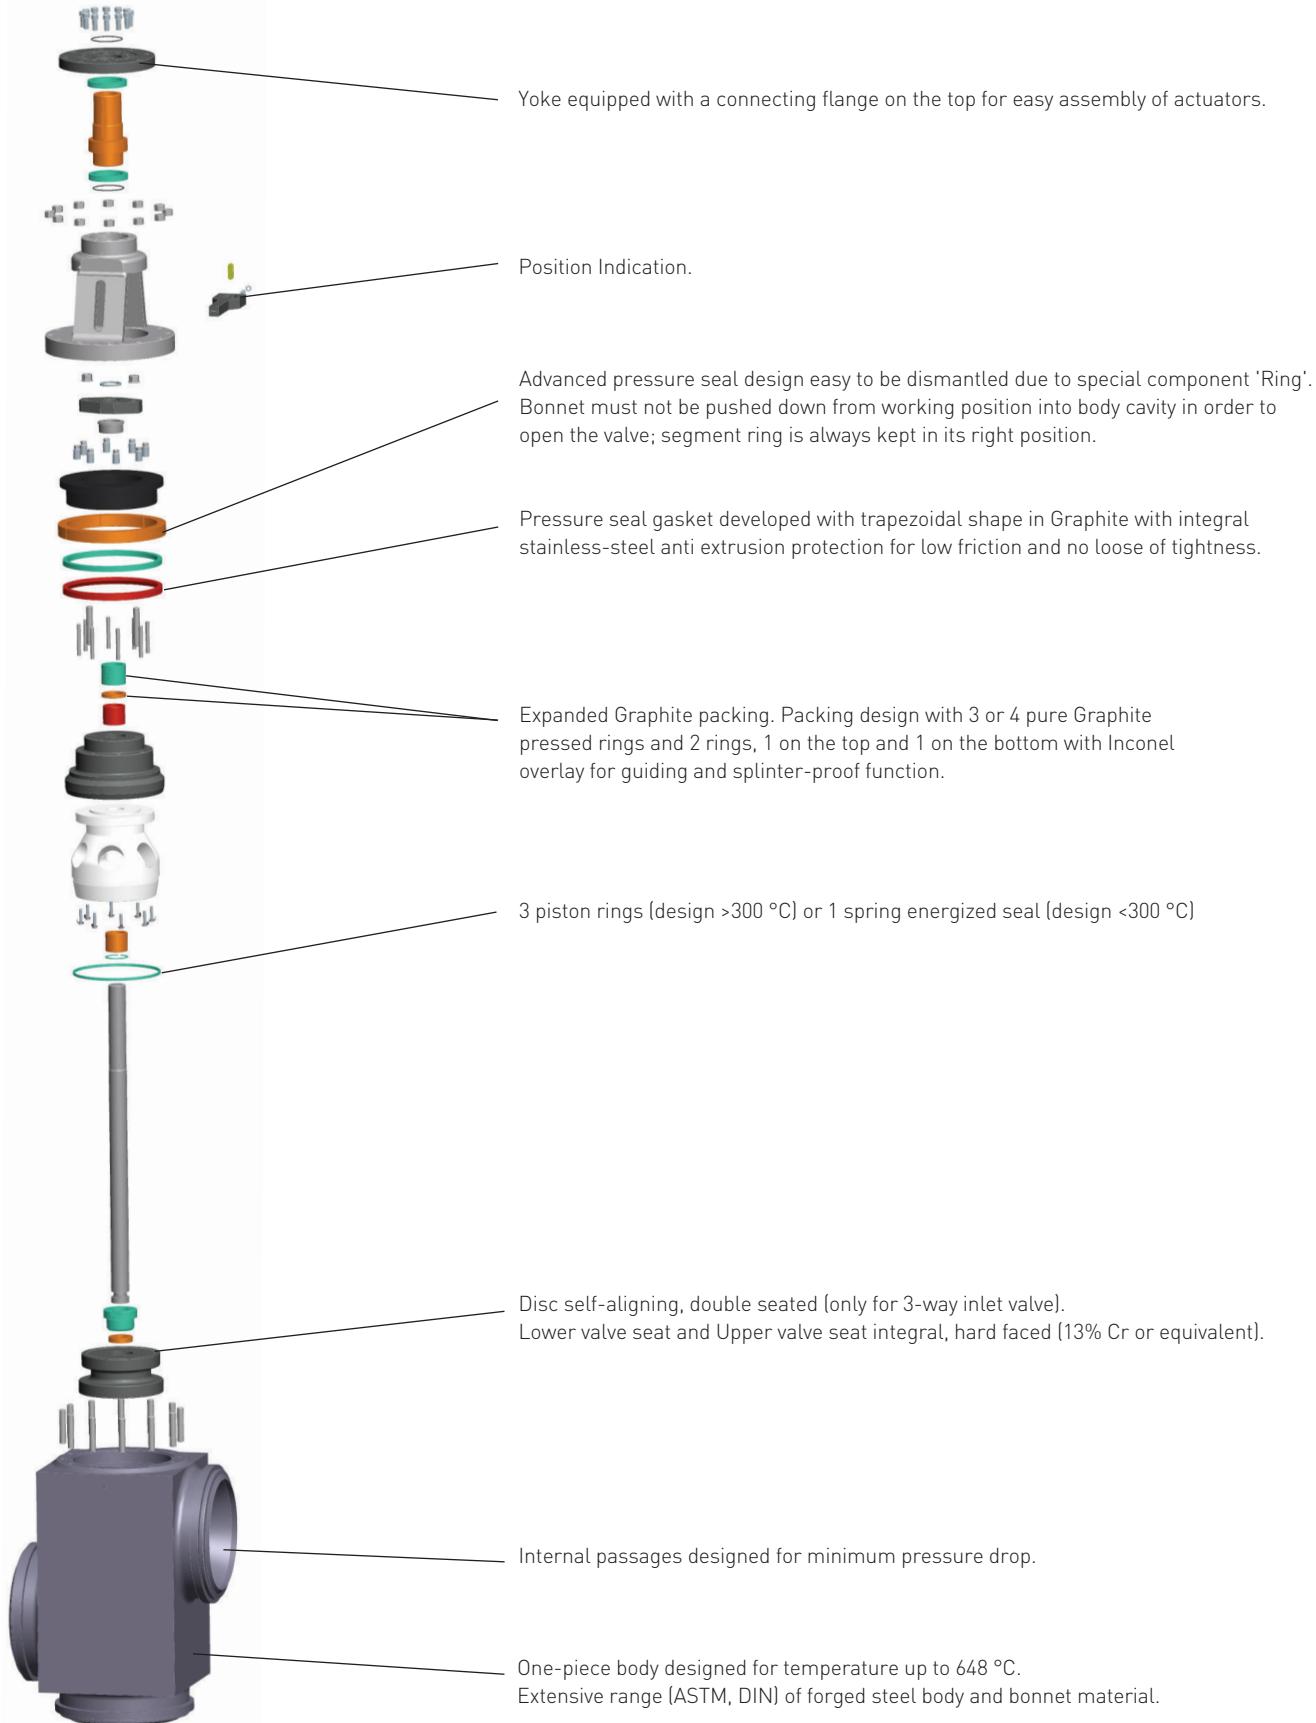

NOTES

1. Other sizes available on request. Please consult supplier.
2. Valves can be supplied together with the ancillary equipment to suit individual customer requirement.

SEMPELL RAISTEAM FEED WATER HEATER
